DETAILED ACTION

This is a first office action in response to application no. 10/663,420 filed September 16th 2003 in which claims 1-23 are presented for examination.

Claim Rejections - 35 USC § 102

1. The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless –

(b) the invention was patented or described in a printed publication in this or a foreign country or in public use or on sale in this country, more than one year prior to the date of application for patent in the United States.

2. Claims 1-23 are rejected under 35 U.S.C. 102(b) as being anticipated by Moroney et al. (US Patent no. 5,949,795).

Regarding claims 1, 10, 16 and 20, Moroney discloses the same method, multimedia receiver, and system comprising a receive data buffer (See Moroney fig. 1, items 100 and 105, col. 5, lines 7-10), and a decoder assembly receiving data from the buffer for decoding thereof (See Moroney col. 5, lines 11-18, lines 55-58), the decoder assembly including a clock, a rate of the clock being established at least in part based upon how full of data the buffer is (See Moroney col. 5, 28-36, lines 58-67, and col. 6, lines 1-4).

Art Unit: 2621

As per claim 2, Moroney further discloses a non-isosynchronous network conveying multimedia to a receiver embodying the buffer and decoder assembly (See Moroney col. 3, lines 34-45).

As per claims 3-5, Moroney further formats the data in MPEG, and the rate is established at least in part by buffer level occupancy (See Moroney col. 3, lines 35-61, and col. 6, lines 32-50).

As per claims 6-9, 11-15, 17-19, and 21-23 most of the limitations of these claims have been noted in the above rejections of claims 1-5. In addition, Moroney further provides the same system wherein the time average buffer level occupancy is established in part at least based instantaneous buffer occupancy levels, and wherein the rate decreases in response to a determination that the buffer occupancy is relatively low and wherein the rate is increased in response to a determination that the buffer occupancy level is relatively high (See Moroney col. 6, lines 32-67, col. 7, lines 1-34 and col. 8, lines 37-54).

3. The prior art made of record and not relied upon is considered pertinent to applicant's disclosure.

Thomson et al. (US Patent no. 5526362) teaches control of receiver stations timing for time-stamped data.

Allen (US Patent no. 5652627) teaches system and method for reducing jitter in packet-based transmission network.

Nichols et al. (US Patent no. 6721328) teaches adaptive clock recovery for circuit emulation service.

Olson et al. (US Patent no. 6594316) teaches method and apparatus for adaptive bit rate control in an asynchronized encoding system.
